A Motivating Scenario: Transportation Network

- Transportation networks contain nodes and arcs.
- Nodes and arcs may be subject to various signals and controls that impact the flow of traffic, e.g. HOV (High Occupancy Vehicle) lanes, turning restrictions).
- The network can be traversed by various things, such as vehicles.
- A vehicle has a make, a vin, a colour, a number of occupants, an owner, a location, and many other properties.

Questions About Transportation Systems

We want to know things like:

- What arcs is this node connected to?
- How many vehicles travelled through these arcs during morning rush hour?
- Can this vehicle turn left at some node right now? (HOV lane, turning restrictions...)
- Where did this vehicle go today?

```
Change over time plays a big role!
```

Existing Work

The traditional representation of fluents is not possible, but there are approaches for capturing change in OWL.

Figure: Approaches to capturing change over time.

- N-ary approach overloads the objects with relations, imposes limitations on what we can express about the fluent relationship.
- We prefer the 4D approach.

イロト イヨト イヨト イヨト

A Revised 4D Approach

Figure: We adopt the reinterpretation of the 4D approach from¹ due to².

¹Chris Welty, Richard Fikes, and Selene Makarios. "A reusable ontology for fluents in OWL". In: Formal Ontology in Information Systems (FOIS). vol. 150. 2006, pp. 226–236. ²Hans-Ulrich Krieger. "Where temporal description logics fail: Representing temporally-changing relationships". In: Annual Conference on Artificial Intelligence. Springer. 2008, pp. 249–257.

Katsumi (EIL, UTTRI)

- We identified a clear, compact design pattern to guide the capture of change over time in the design of domain ontologies.
- Given some concept that is subject to change (from an existing ontology, or when designing from scratch), the design pattern guides:
 - The import and extension of a simple ontology of change
 - The specification of additional rules

A small set of axioms introduces the foundation required to adopt this approach:

- TimeVaryingEntity: the *perdurant* class that exists and changes through time.
- Manifestation: the class of "time-slices" of a perdurant.
- hasManifestation: a TimeVaryingEntity has some manifestation(s).
- existsAt: TimeVaryingEntity and Manifestation objects exist at some interval or instant in time.

Image: A math a math

- Import the Change Ontology
- Identify time-variant classes
- **③** Distinguish between the variant and invariant properties for these classes
- Fill-in the blanks...

The Pattern I

Example

Consider a simple, atemporal representation of a Vehicle:

 $\label{eq:Vehicle} \begin{array}{l} \sqsubseteq = 1 \\ \mbox{hasColour.Colour} \\ \mbox{Vehicle} \sqsubseteq = 1 \\ \mbox{hasMake.Manufacturer} \\ \end{array}$

Image: A math a math

The Pattern II

Objective C as a subclass of Manifestation.

Axiom Type

 $\underline{C} \sqsubseteq Manifestation$

Vehicle $\sqsubseteq = 1$ hasVin.Vin Vehicle $\sqsubseteq \forall$ hasColour.Colour Vehicle $\sqsubseteq = 1$ hasMake.Manufacturer Vehicle $\sqsubseteq Manifestation$

イロン イ部ン イヨン イヨ

The Pattern III

Optime the perdurant (TimeVaryingEntity) counterpart class for the concept.

Axiom Type

 $\underline{PD_C} \sqsubseteq \texttt{TimeVaryingEntity}$

The Pattern IV

The Manifestation subclass will have both variant and invariant properties. Include any invariant properties from the Manifestation subclass in the axioms for the TimeVaryingEntity subclass. Where <u>invariantProperty</u> is the invariant property and <u>CE</u> is the class expression:

Axiom Type

 $\underline{PD_{C}} \sqsubseteq \underline{invariantProperty}.\underline{CE}$

(invariant) Vehicle $\sqsubseteq =1$ hasVin.Vin Vehicle $\sqsubseteq \forall$ hasColour.Colour (invariant) Vehicle $\sqsubseteq =1$ hasMake.Manufacturer Vehicle \sqsubseteq Manifestation VehiclePD \sqsubseteq TimeVaryingEntity VehiclePD $\sqsubseteq = 1$ hasVin.Vin VehiclePD $\sqsubseteq = 1$ hasMake.ManufacturerPD

イロト イヨト イヨト イヨト

 Restrict the hasManifestation relationship for this new pair of TimeVaryingEntity and Manifestation subclasses.

Axiom Type

 $\frac{PD_{C}}{\sqcap \forall} \equiv \exists hasManifestation.\underline{C} \\ \sqcap \forall hasManifestation.\underline{C}$

Axiom Type

 $\underline{C} \equiv \exists manifestationOf.\underline{PD_C} \\ \sqcap \forall manifestationOf.PD_C$

<ロト </p>

 $\mathsf{Vehicle} \sqsubseteq = \mathsf{1}\mathsf{hasVin}.\mathsf{Vin}$

 $\mathsf{Vehicle} \sqsubseteq \forall \mathsf{hasColour.Colour}$

 $\mathsf{Vehicle} \sqsubseteq = 1 \mathsf{hasMake}.\mathsf{Manufacturer}$

 $\mathsf{Vehicle} \sqsubseteq \mathsf{Manifestation}$

VehiclePD ⊑ TimeVaryingEntity

VehiclePD $\sqsubseteq = 1$ hasVin.Vin

 $VehiclePD \sqsubseteq = 1hasMake.ManufacturerPD$

VehiclePD $\equiv \exists$ hasManifestation.Vehicle $\sqcap \forall$ hasManifestation.Vehicle

 $\mathsf{Vehicle} \equiv \exists \mathsf{manifestationOf}. \mathsf{VehiclePD} \sqcap \forall \mathsf{manifestationOf}. \mathsf{VehiclePD}$

• • • • • • • • • • • • •

- **Our goal:** simplify the process of incorporating change over time and increase its accessibility for a wider audience of Semantic Web practitioners.
- The design pattern we've proposed:
 - elicits temporal information in an effective, efficient manner.
 - is particularly useful for reusing atemporal ontologies.
 - also specifies a possible extension beyond OWL in order to support reasoning about the relationship between the properties of a TimeVaryingEntity and those of its Manifestations
- See the paper! Come visit the poster!
- We gratefully acknowledge support provided by the Ontario Ministry of Research and Innovation through the ORF-RE program.
